

Coding and Solution

Date	8 July 2026
Team ID	SWETID-2026-5556
Project Name	Credit Card Approval Prediction
Maximum Marks	5 Marks

Coding and Solution:

This section evaluates the source code implementation of the Credit Card Approval Prediction System. It details the development stack, includes the project repository link, and highlights the core functional requirements built into the final software solution.

Solution Summary:

Field	Details
Repository Link / URL	https://github.com/jayasritarini387/Credit-Card-Approval-Prediction.git
Programming Language(s)	Python
Framework(s) Used	Flask (Backend API), HTML5 / CSS3 (Frontend UI)
Key Features Implemented	• Secure JWT User Authentication & Registration. • Dynamic multi-input form for applicant financial data entry. • Automated data scaling and pre-processing engine. • Machine Learning classification pipeline assessing default risk. • Interactive results dashboard delivering real-time approval verdicts.
Pending / Incomplete Features	• Live integration with standard third-party credit bureau APIs (currently running on realistic simulation data).
Setup / Run Instructions	1. Clone repository: https://github.com/jayasritarini387/Credit-Card-Approval-Prediction.git 2. Install packages: pip install -r requirements.txt 3. Execute backend app instance: python app.py 4. Navigate your web browser to: [http://127.0.0.1:5000] (http://127.0.0.1:5000)

Code Quality Checklist:

S No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes.	Yes
2	Meaningful variable and function names are used.	Yes
3	Code includes comments / documentation where necessary.	Yes
4	Error handling is implemented for critical operations.	Yes
5	Application runs without critical errors.	Yes
6	Code is committed to a version control repository.	Yes

Additional Notes / Comments:

The project source implementation follows the unified PEP 8 coding structure. Data scaling functions are kept isolated from testing scripts to strictly prevent information leaks during verification steps. Exception handling blocks are completely covering user file uploads, model loads, and runtime array calculations to handle incomplete application fields safely.
